# Basic circuits with an operational amplifier

In this experiment we have built five different circuits. The first is an open loop circuit with the operational amplifier uA741, the goal was to find the maximum voltage outputed by the op-amp as justified from the equation $v_o = A_{ol}(v_+ - v_-)$ where $A_{ol}$ tends to infinity in the ideal model. The last four circuits are in closed loop configuration with a negative feedback, they consist on a follower, a non inverting amplifier, an inverting amplifier and a weighted summing amplifier. We have measured the voltage input and the voltage output of every circut.

## 1.1 Materials

- Operational amplifier uA741
- Resistor, nominal value: 100 Ω, 220 Ω
- Power supply
- Other stuff

## 1.2 Experiment setup

Figure 1.1: Open loop circuit
Figure 1.2: Follower

Figure 1.3: Non inverting amplifier

Figure 1.4: Inverting amplifier

## 1.3 Data analysis
